**ISBN**

**International Standards Book Number**
The purpose of having a standard number is to give a book a unique identification. ISBN can be assigned to any monographic publication or map that is widely distributed. This includes self-publishers or individuals with private publishing. The use of ISBN is advantageous to libraries and bookshops because it uniquely identifies a publication. ISBNs are voluntary, and confer no copyright or other legal protection, nor do they provide name protection. Protecting a company name requires registration with the Swedish Companies Registration Office. In Sweden, the ISBN system is administered by ISBN Sweden, which is organized under the National Library of Sweden.

**ISBNs can be assigned to:** audio cassettes, disks, CD-ROMs, DVDs etc., provided that their contents are equivalent to books. If these are published in conjunction with a printed publication, then the whole package can have the same ISBN. If, on the other hand, each part is to be sold separately, then each may have a different ISBN. ISBN can also be used for online publications if the documents are monographic and of a relatively permanent nature. These can be novels, theses, or serial monographs, all of which can be ordered in bookstores. It is recommended that ISBN be included in the publication’s metadata.

**ISBNs should not be used for:** printed music, newspapers, serials, offprints (if not published in special publishers’ articles), non-commercial, online publications that are of general character and are accessible by the general public, art sheets and portfolios without a title page or text, catalogues from private firms, price lists, instructional manuals (unless they have bibliographical or other value), loose-leaf systems, theatre and exhibition programmes, calendars, forms, games (comprehensive game manuals may have ISBNs, independent of whether or not they are sold separately or together with the games) or colouring books.

**New editions / reprints**
A new edition of a publication with significant changes, such as new type setting, new format or binding, revisions or expansions, new in a series or a new publisher requires a new ISBN. A reprint, with only a new publishing year, new price or corrected spellings, should be assigned the same ISBN as the previous print. A reprint of a publication with a 10 digit ISBN should be assigned a converted 13 digit ISBN number. You can convert 10 digit numbers into 13 digit numbers using a converter on ISBN Sweden’s website.

**Applying and assigning ISBNs**
All publishing units, publishers, associations, institutions, or private persons etc. with an address in Sweden and operations here can obtain an ISBN free of charge, regardless of where the publication will be distributed. Any publisher meeting these requirements can apply for and retrieve ISBN online at ISBN Sweden’s web service, please see [https://isbn.kb.se](https://isbn.kb.se)
Construction and printing of ISBN

An ISBN consists of 13 digits and is preceded by the letters ISBN. An ISBN is divided into five blocks, separated by hyphens or blanks:

ISBN 978-91-7000-150-5 (example)
1. The current ISBN-13 standard is prefixed by 978
2. Group or country identifier which identifies a national or geographic grouping of publishers (91=Sweden)
3. Publisher identifier which identifies a particular publisher within a group (e.g. 7000)
4. Title identifier (e.g. 150)
5. Check digit is the single digit at the end of the ISBN which validates the ISBN (e.g. 5)

The ISBN should correspond to the publisher’s information found in a publication and should be printed in its entirety. Each ISBN is to be used only once and identifies the publication. The ISBN must appear on the pages of the book, preferably the verso of the title page. If there is no space on the title verso it may appear on the foot of the title page, and if possible on the outside (foot of the back of the jacket and/or the lower section of the outside back cover). If it is not possible to have the ISBN on the back cover, then it may be omitted. The ISBN that is found on the title page, however, must always be present.

Barcodes
The bar code system was created to provide a standard to rationalize the processing and handling of products. The 13-digit ISBN is identical with GS1’s article number GTIN-13 (EAN-13). The EAN-number is barcoded to be machine readable. ISBN Sweden does not provide barcodes. If the printing office you are using does not provide a barcode service please contact a barcode provider. For more information about barcodes and providers, please see www.gs1.se/en/.

Other standard numbering systems:
ISSN (International Standard Serial Number) is a standard number that is used in the identification of serials, such as magazines, annuals and newspapers. Some serial publications may have both ISBN and ISSN.
ISMN (International Standard Music Number) is a standard number for printed music. ISMNs are administered by ISBN Sweden.
URN:NBN (Uniform Resource Name: National Bibliographic Number) is a unique and permanent identifier for online electronic resources. URN:NBNs are administrated by administrators for digital legal deposits.

Legal deposit
The usage of ISBN has no connection with the obligation to send legal deposit copies. For information about legal deposits, please see www.kb.se/english/services/deposits/.

The National Library of Sweden
The National Library of Sweden’s (KB) mission is, as the National Library of Sweden, to promote Swedish research, science and culture by collecting and preserving Swedish literature and literature published abroad that relates to Sweden. KB also compiles products such as the Swedish National Bibliography and supports the Swedish library community with national initiatives.
